

## Animal Magnetism

It turns out that GPS technology is good for more than just getting us to a new restaurant or for scoping out our dream home on the Italian Riviera.

Scientists are employing satellites to track the movement of animals and the patterns reveal that cows, deer, birds and other animals seem to have a magnetic sense that dictates the directions in which they travel.

For instance, new research by wildlife biologist Jaroslav Červený has found that fox tend to track and pounce on their prey in a decidedly north-easterly direction. These animals seem to be using the earth's magnetic fields to help them survive through successful hunting and feeding patterns.

The same principles apply to the use of the earth's crystals to direct our inner compasses toward patterns of good health and prosperity.

At our Indian Point retreat in September, Nicole Kay, founder of Atlas Trove, will show us how to use healing crystals to enhance our emotional compassion and improve our physical vitality. We will explore how crystals can further our understanding of the Five Element Feng Shui system as we experience our elements in nature amid the forests of Maine, the crystal blue waters of Rangeley Lake and roaring fires on cool nights. Check out the entire [itinerary](#) as well as photos of our exquisite [private retreat](#) facilities and then [reserve your spot](#) today!
